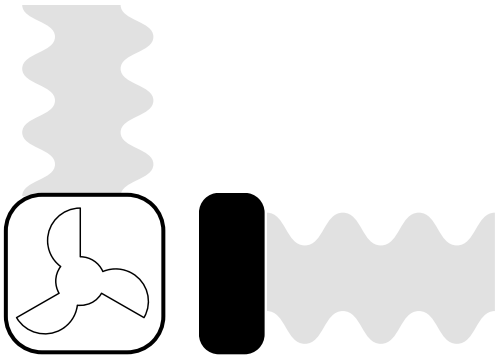
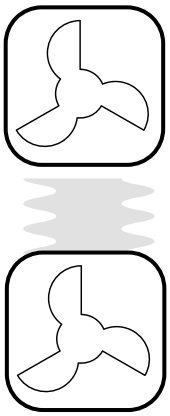
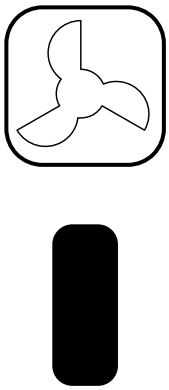
Fan

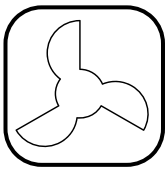


Properties	Colour: Black, grey wind Element: Wind
Behaviours	Pushes objects and entities away from it until they hit something Blows fires out, freezes ice.
Game State Feedback	Audio: Makes a whirring noise when on Shape: Wind wiggles when on
Systemic Feedback	Affects other objects when wind passes over them

Fan

Togglable	Rotatable	Static
		






Movable: Can be pushed and rotated by player

Togglable: Can be turned off or on by hitting it

Rotatable: Can be rotated by hitting it

Static: Cannot be moved

Torch

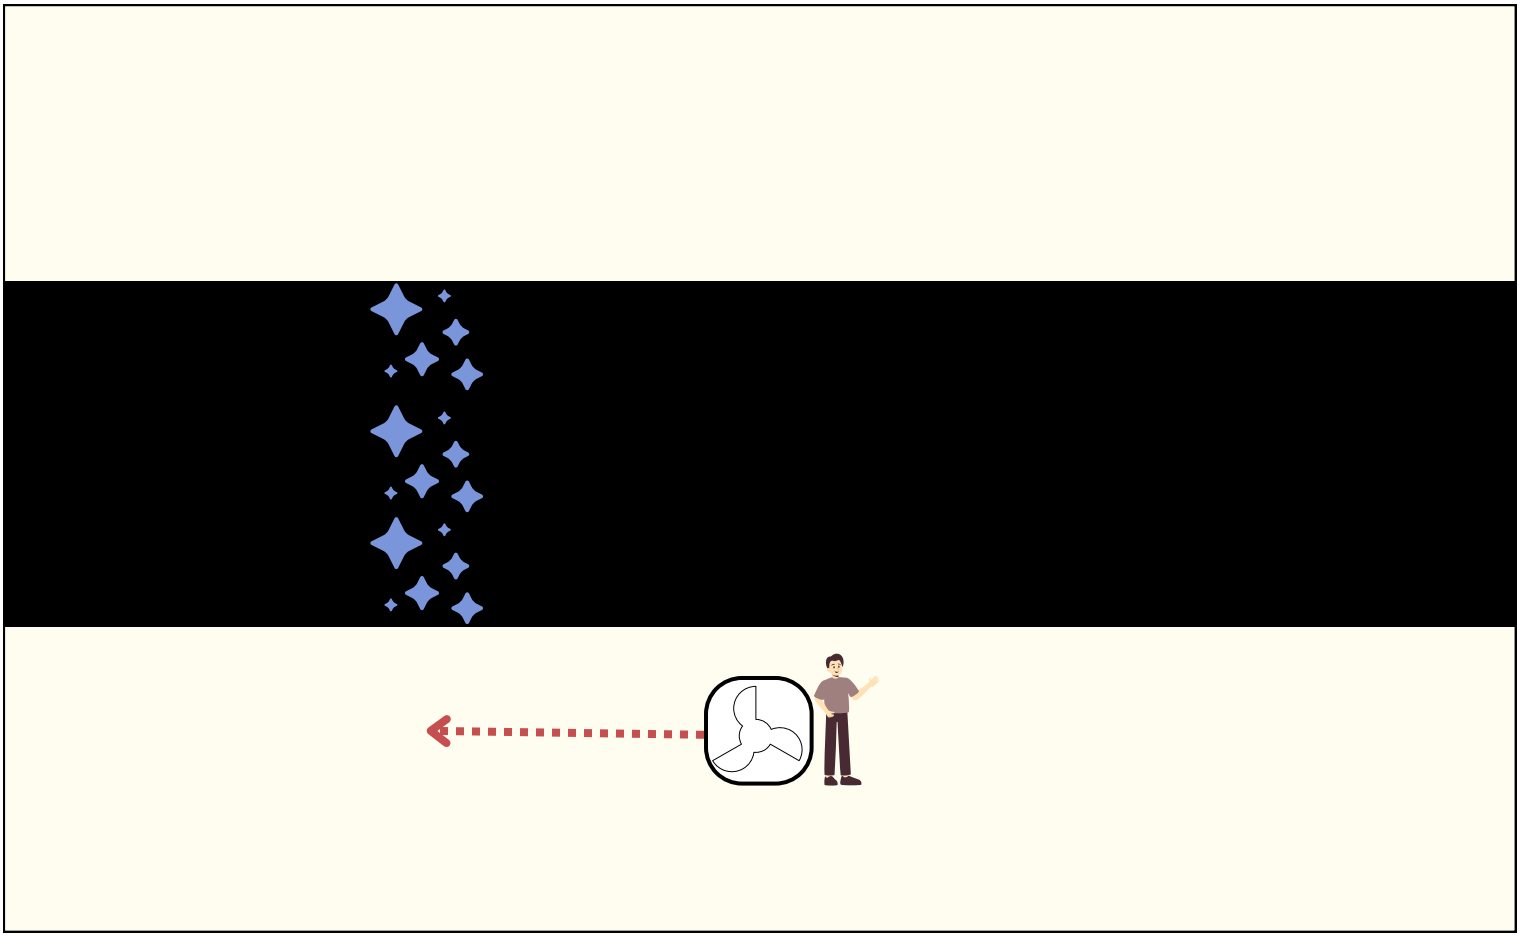
Lit	Unlit

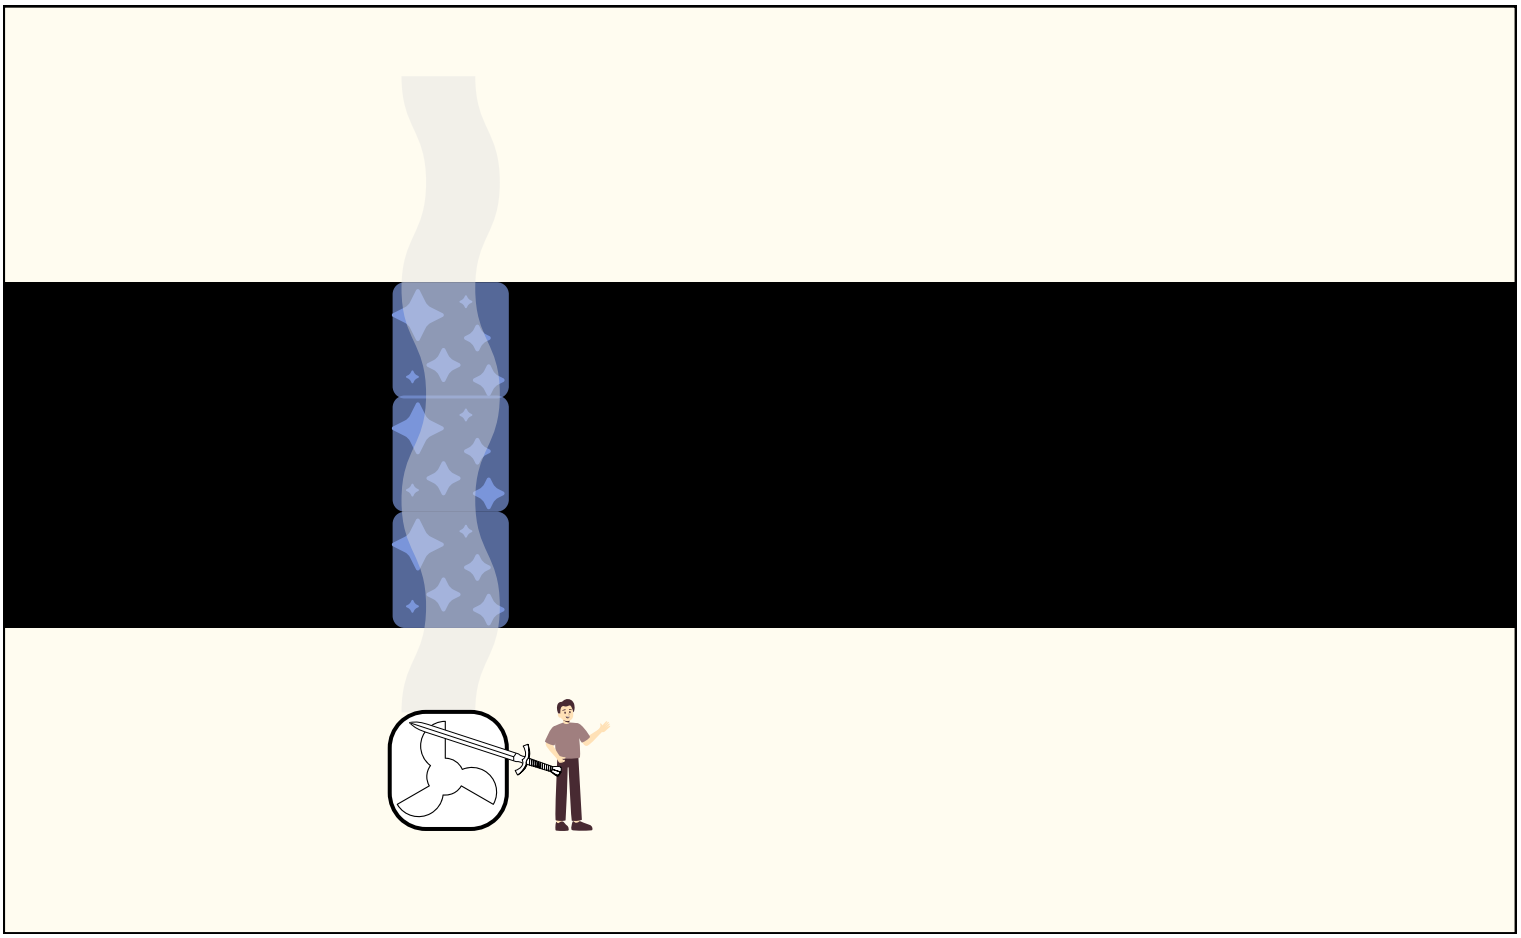
Properties	Toggle: Lit or unlit Colour: Blue when lit
Behaviours	Can be unlit by fans
Game State Feedback	Audio: makes a slight flickering noise when lit Visual: On fire when lit, emits light
Systemic Feedback	Acts as a toggle switch for other objects, such as doors or other fans

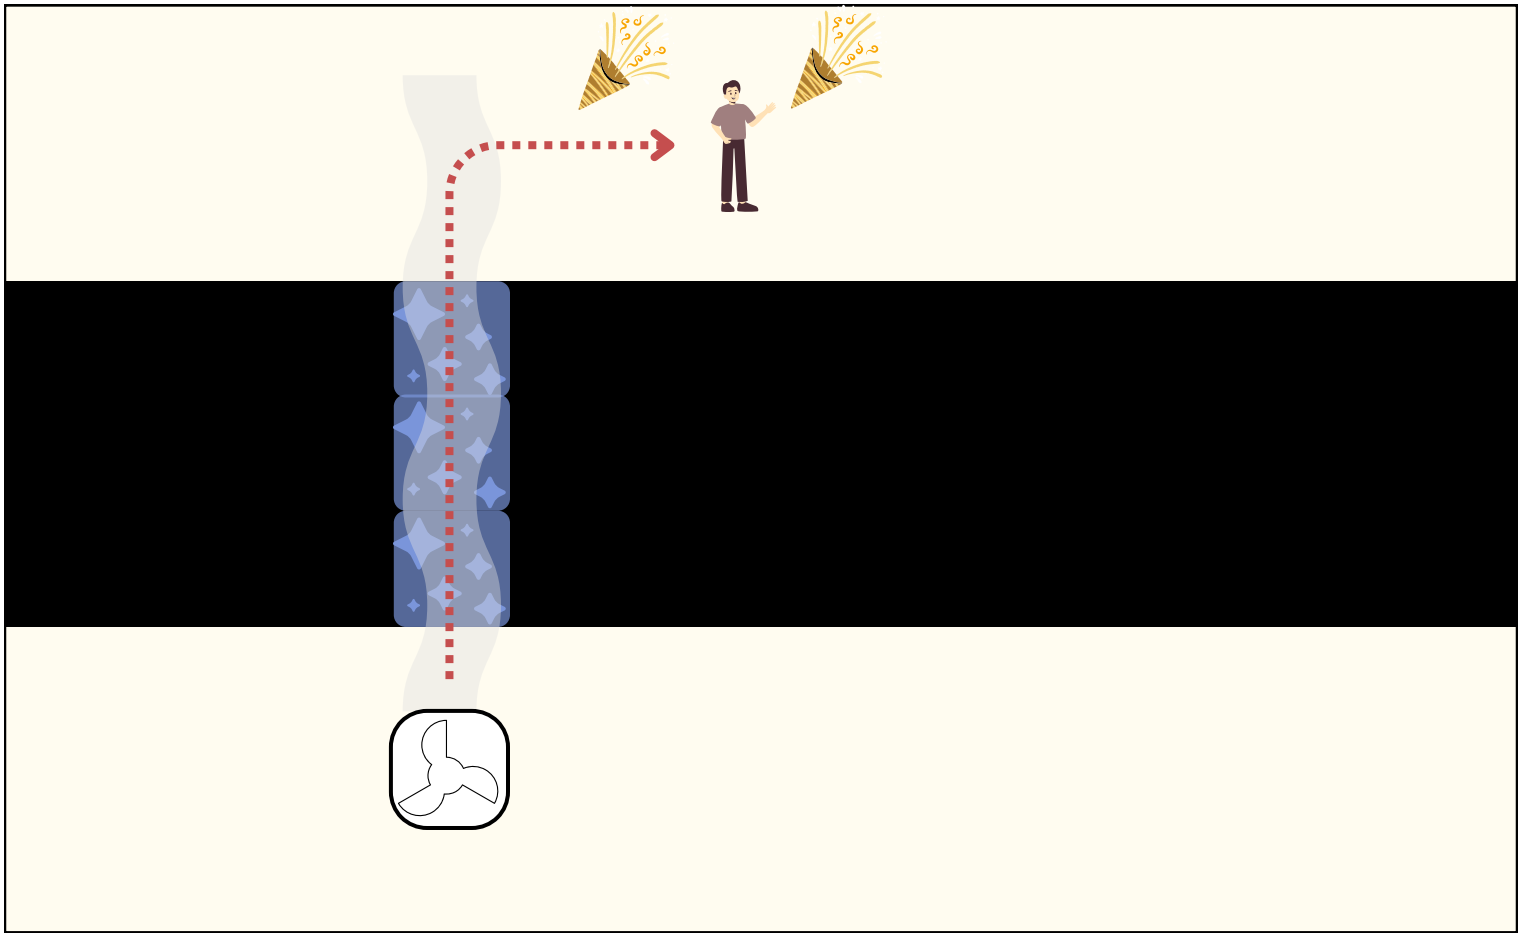
Cloud Block

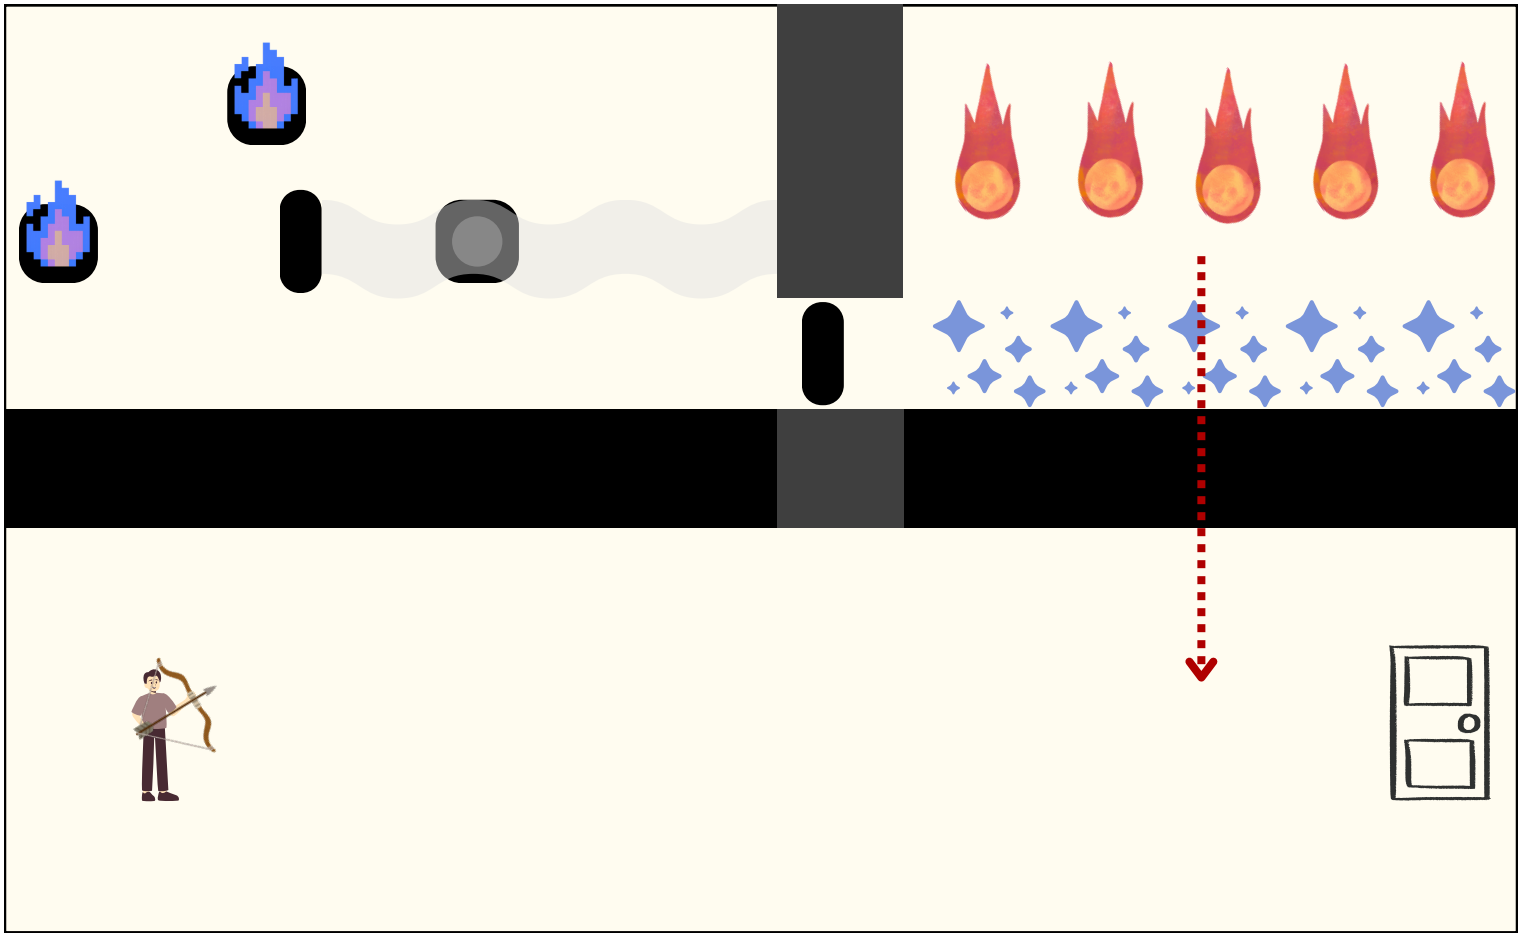
Gas	Solid

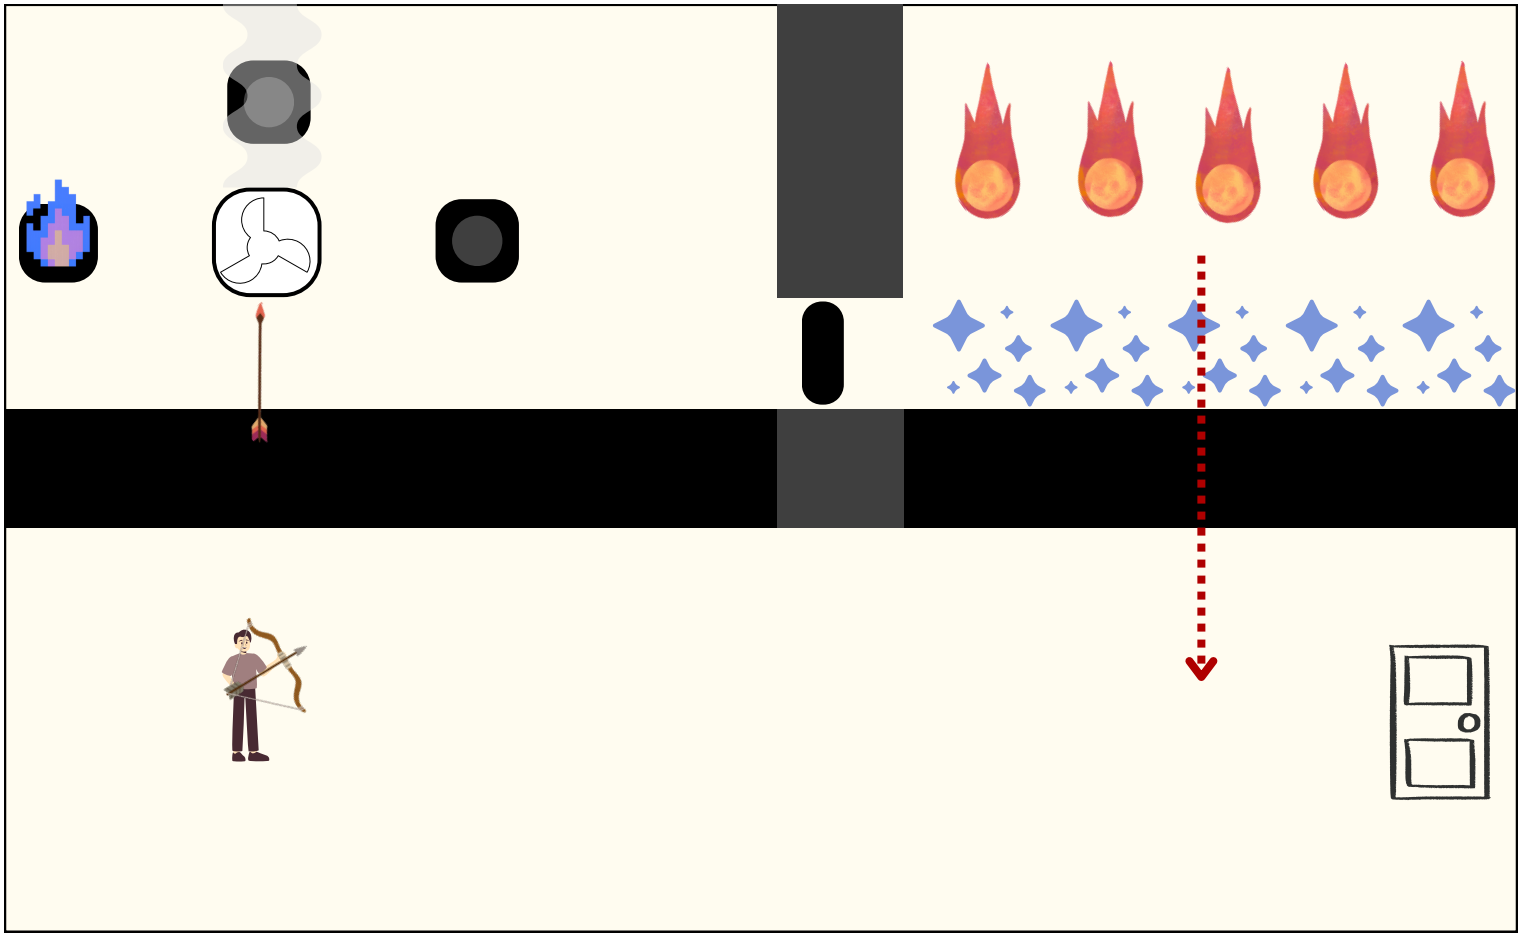
Properties	Tangibility: shifts between tangible and intangible depending on state Toggle: gas to solid
Behaviours	When gas: Cannot be touched by entities, does not have weight When solid: Can be touched by entities, has weight, elemental cannot go through
Game State Feedback	Visual: Twinkles lightly, changes from gas-like to solid Audio: Makes a shrivelling noise when solidifying
Systemic Feedback	Can be walked through when gas Can interact with floor objects such as buttons when solid Can block elemental properties when solid

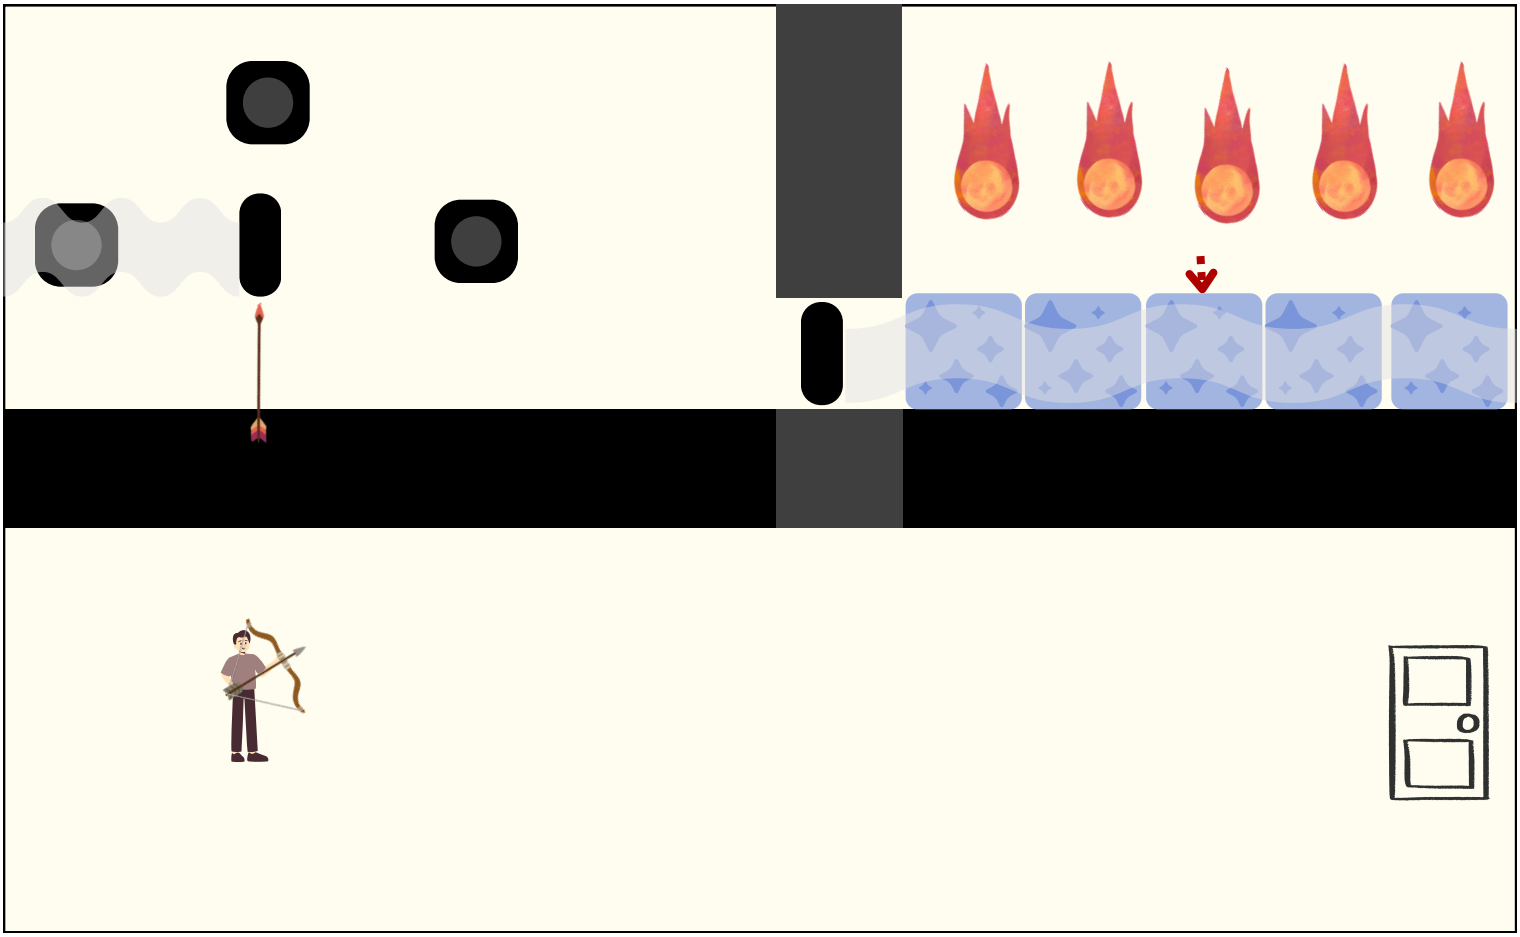


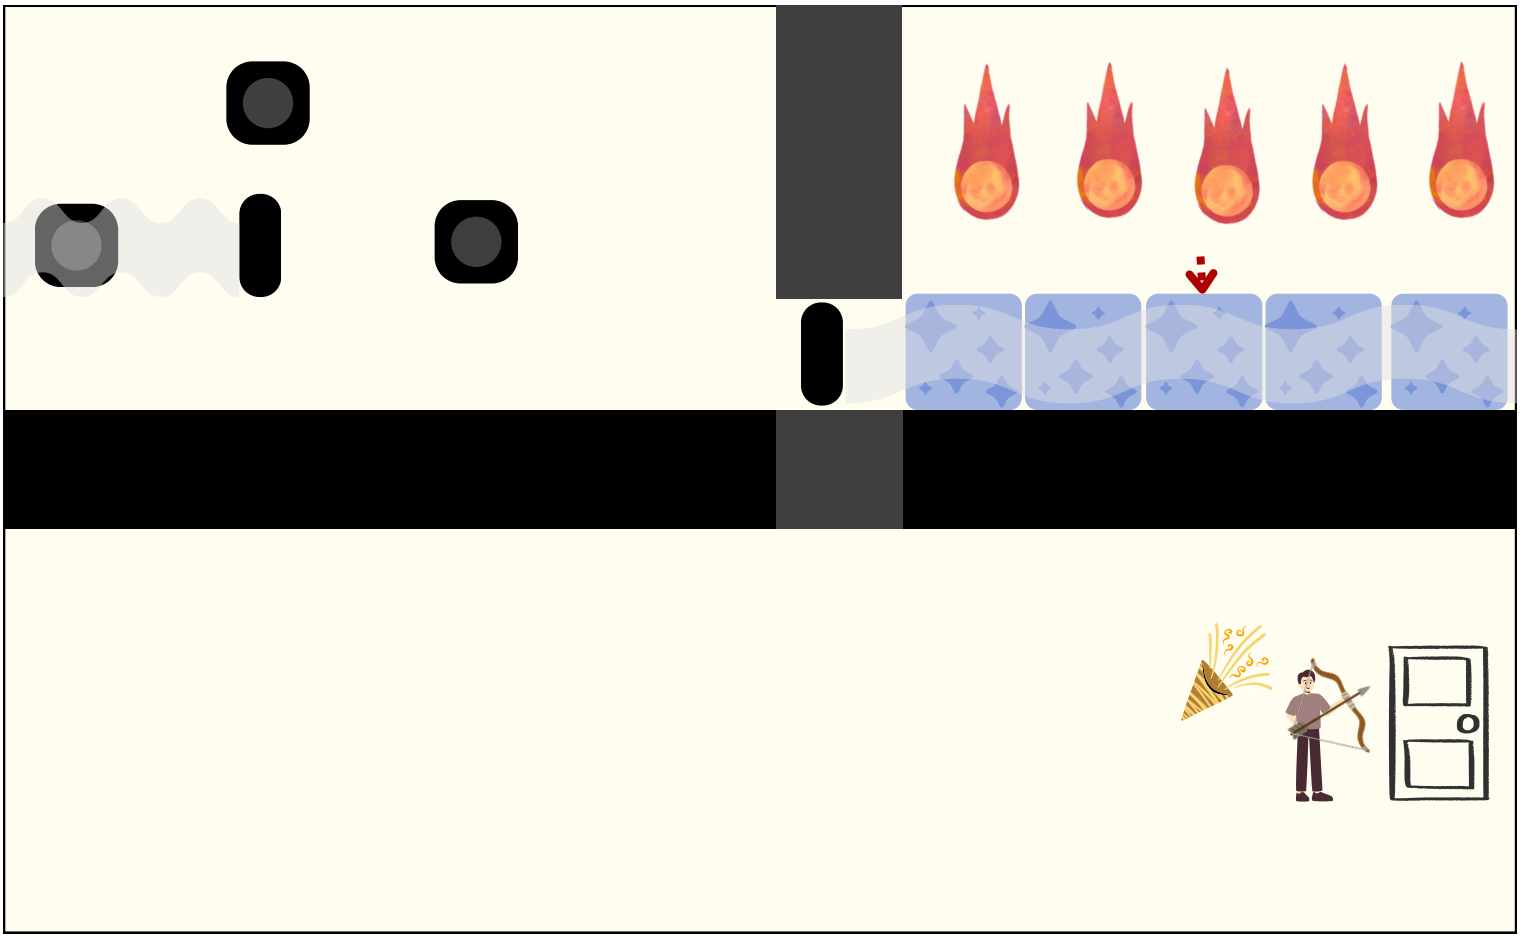




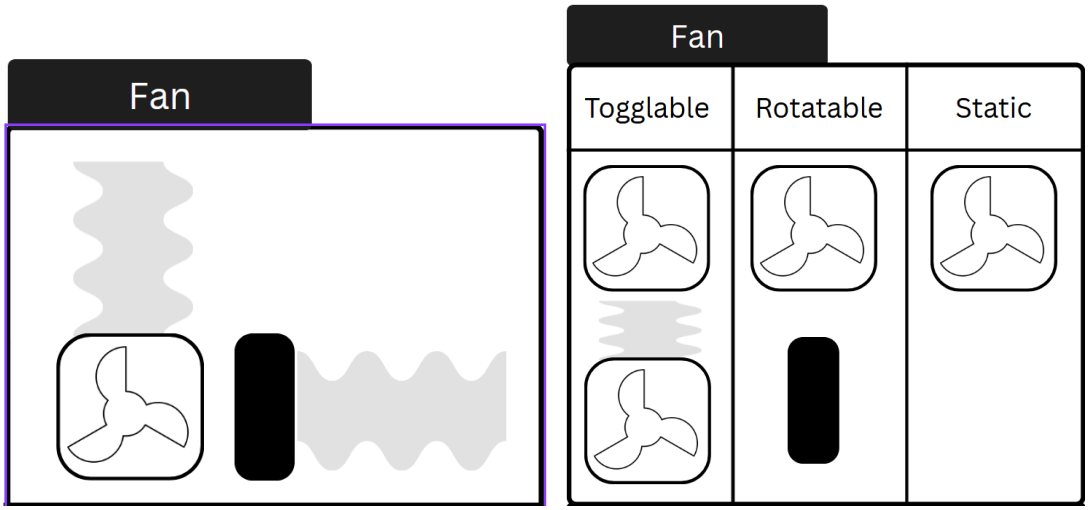








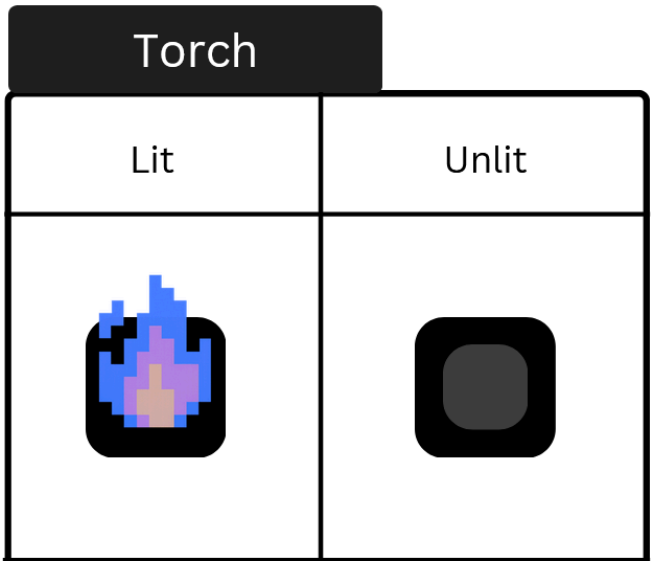
1. **Fan**



The primary design concept for this object was to create an object that could interact with multiple different mechanics as well as acting individually. It blows wind into a straight line, moving entities within its path. It also has the elemental property of wind, allowing it to blow out fires and freeze certain objects. The players must use these primary properties to solve puzzles surrounding the object.

The fan has several different permutations, static, rotatable, togglable, and moveable. Each of these can be combined with one another to create different experiences for the player. If the fan is rotatable or togglable, this state can be changed by attacking it. This allows for both up-close and ranged activation of the block, and creates more options for puzzles.

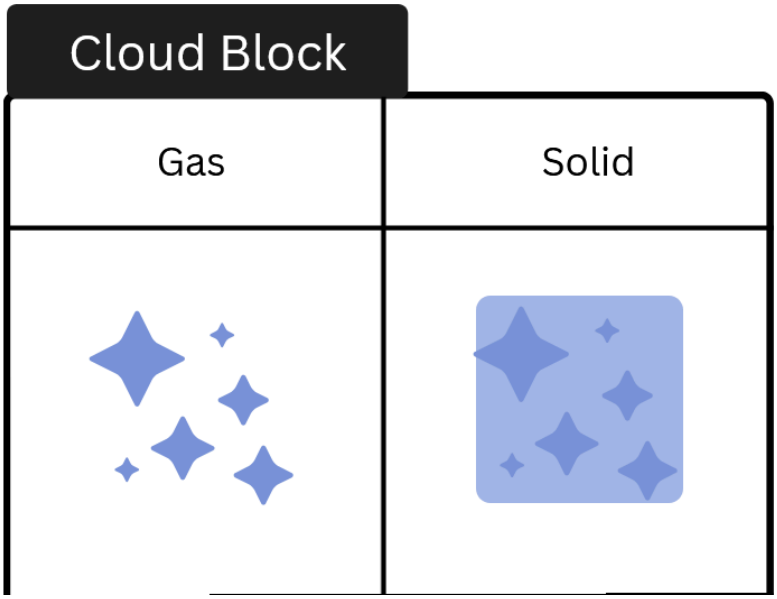
2. **Blue Flame Brazier**



The primary design concept was to create a togglable action that could be set up to work with various objects, such as the aforementioned fan or locked doors. It is by default toggled on, and must be blown out by the fan, creating a coupled interaction. Its colour was chosen to create readability, especially if regular braziers are in the game, such as many of the Legend of Zelda games.

It only has two states, lit and unlit, and those states are only affected by the fan object. This change is signaled by whether or not the block itself is on fire. It is individually plain, but when interacting with other objects, it creates many different possibilities, making it a context-dependent interaction.

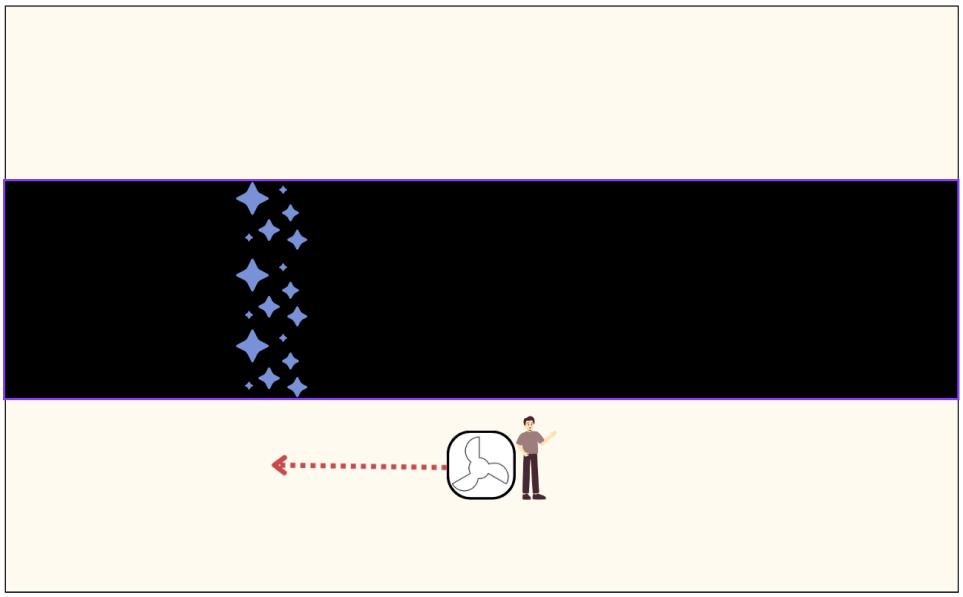
3. **Cloud Block**

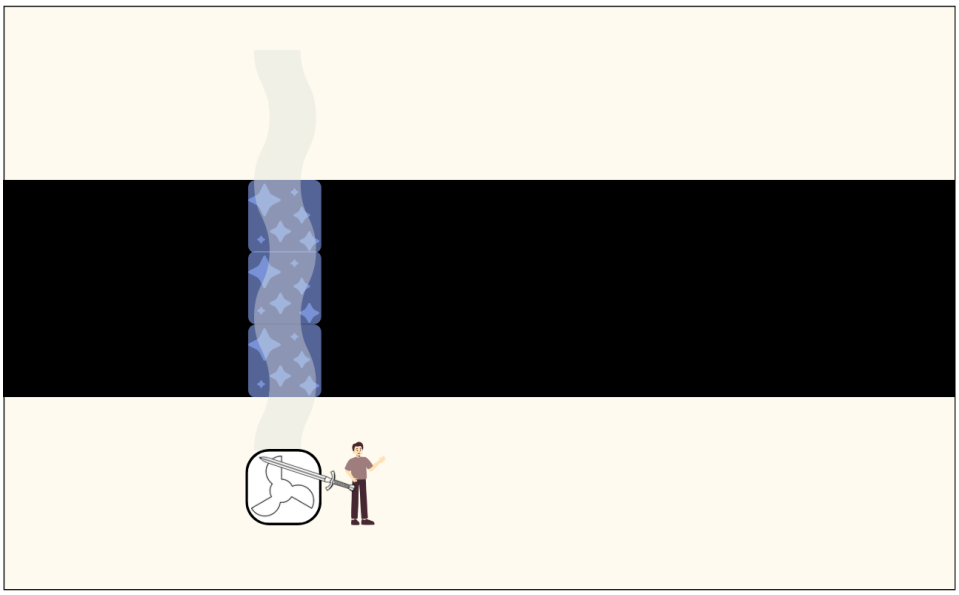


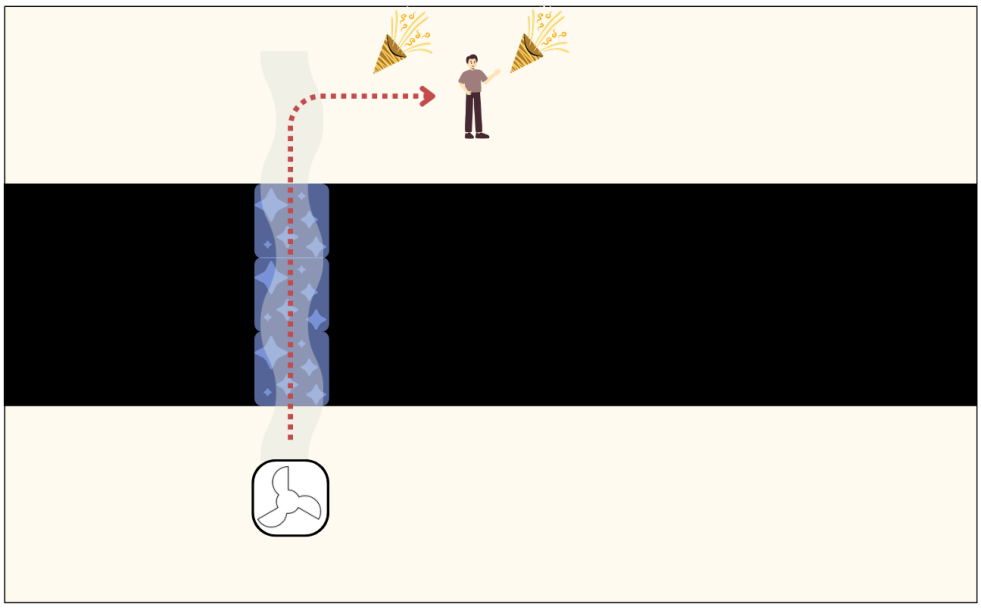
The primary design concept was to create a modular use case for the fans to solve puzzles and reach certain areas. The cloud block is a block that interacts with the fan in order to become tangible, allowing players to stand on it, blocking elemental attacks, and activating switches that it is on top of.

The cloud block has two states, tangible and intangible. In its default state, it is intangible, and objects and entities can move through it. When a fan crosses over it, it solidifies, and gives it a mass and semi-solid property. This creates many possibilities for interactions and puzzles, and allows for the cloud block to be used over and over without feeling repetitive.

2.1. Scenario 1

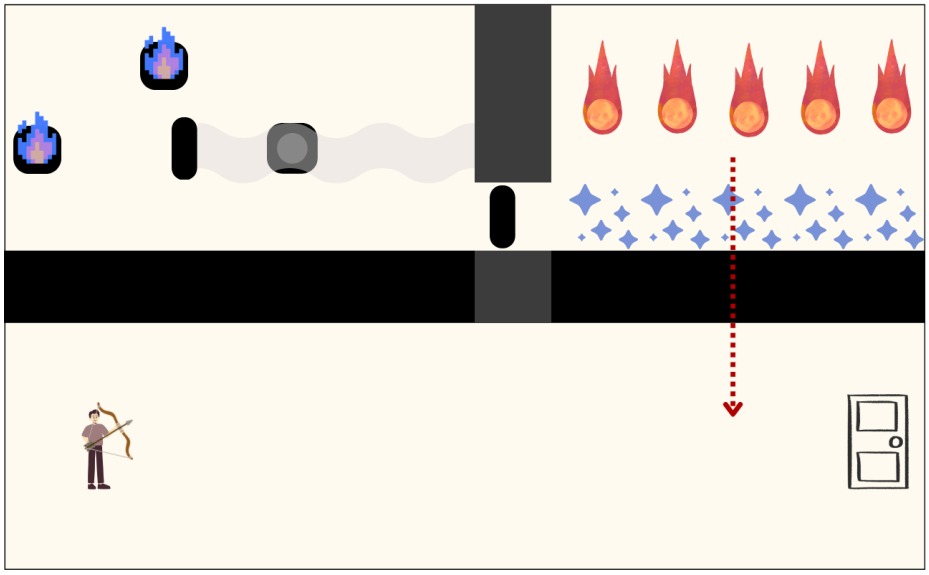


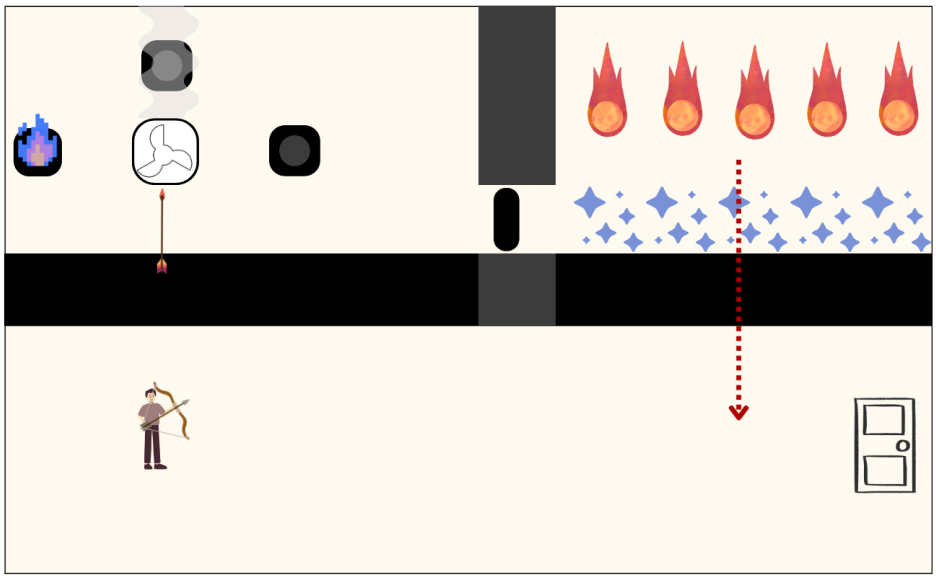


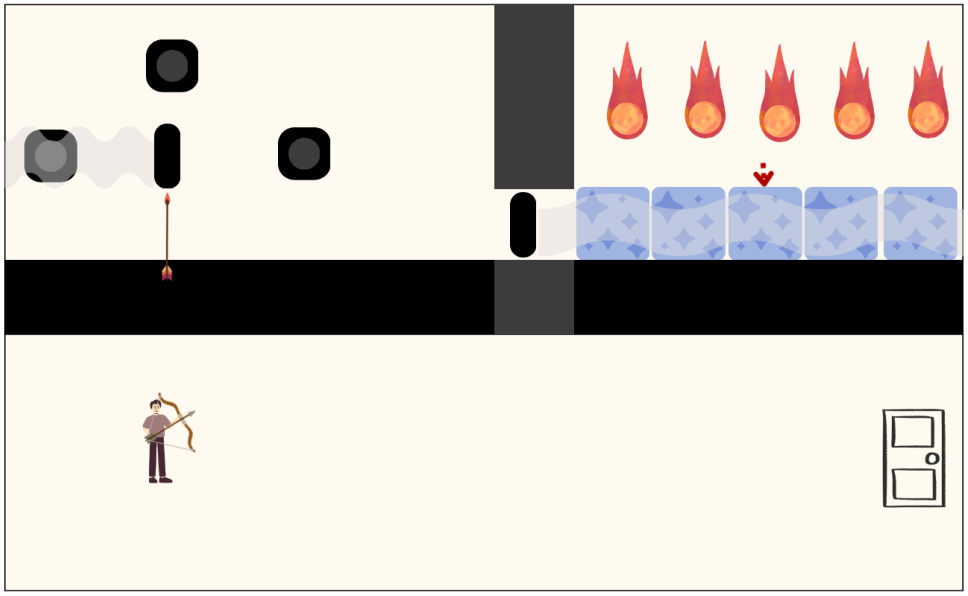


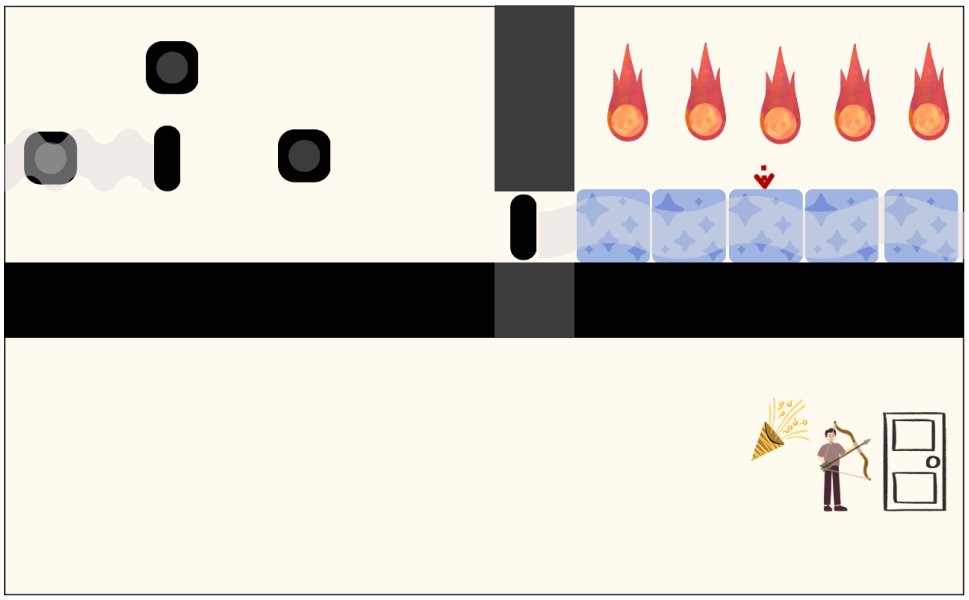
In this scenario, I wanted to show off the relationship between the fan and the cloud block, as well as showing off its semi-solid property by being able to hold the player's weight. This introduces the moveable and toggleable permutations of the fan as well, and shows a potential use for it. It creates both a way to reach other areas as well as creating a one way entrance to prevent enemies from crossing over to the player.

2.2. Scenario 2









In this scenario, I wanted to show off the context-dependent interaction between the blue flame brazier and the fan, and how it can be used to remotely toggle objects. I also wanted to show the relationship between elemental attacks and the cloud block, and how it can be used to stop the projectiles and prevent danger for the player.
